### Introduction

Harvested roses have to be treated and cared for correctly to ensure the best vase life at the consumer. Often roses become flaccid, show bent-neck or remain in the bud stage. The most important reason for this is a deficient water uptake, caused by an excessive bacterial growth and air bubbles in the stems. A hygienic way of working, fresh water and the use of **Flowercare roos export** brings every rose to a complete bloom.

### Working

**Flowercare roos export** contains substances that increase water uptake even after dry storage and reduce bacterial growth.

### Dosage

**Flowercare roos export:** 2 ml per liter water. Life of solution: 1 - 3 days.

*Note: always use clean tap water and clean, with chlorine disinfected buckets.*

*Never mix an old solution with a fresh one. Avoid any contact of the **Flowercare roos export** solution with metals.*

### Treatment

Place the freshly cut roses in the **Flowercare roos export** solution within 15 minutes after harvest. Leave the roses in this solution for at least 3 hours before grading. After grading, the roses can be placed again in a **Flowercare roos export** solution. The flowers can be cooled down to 2°C before packing.

### Active ingredients

**Flowercare roos export:** Non-ionogenic wetting agent and Aluminium sulphate.

### Packing

**Flowercare roos export** is available in 10 and 25 liter jerry cans and 200 liter barrels.
